

E-mail from the developer summarising the changes:

*“This is a pending application, which was originally submitted to amend the noise conditions on the site and remove the requirement for augering in certain locations (replacing this with a general noise level with which the construction must comply).*

*Revised plans and drawings have now been submitted as part of the application, with a view to making minor-material amendments to its layout and appearance. I appreciate there are quite a few plans and drawings, so I prepared the attached summary for Huntingdonshire. This should assist as you review the submitted information and compare it to the originally approved plans. Page 3 of the attached sets out a clear summary of the approved and replacement plans/drawings.*

*The main change is the substantial reduction in the area of solar panels which will be deployed at the airfield. This will have a noteworthy benefits in terms of landscape and visual impacts as well as reducing amenity impacts on dwellings around the site. The attached sketch shows the areas of panels which have been removed at the airfield (crossed out in pink). To balance this out, panels have been added at Top Farm, primarily adjacent to the woodlands. This is considered a less sensitive location as it is well screened by the woods and the existing mature hedge along the footpath, so there will be no additional visual impacts. The attached sketch shows this (new areas highlighted green).*

*The landscaping which was required and approved by the original planning permission has been broadly reflected by the amended proposals, based on the revised layout. The space between the rows of panels has been increased, reducing the visual ‘massing’ of the proposals. There were 32 inverters approved, we now propose to install only 12. These are noteworthy benefits of the changes, alongside the overall reduction in the area of panels.”*
